

UNIT – IV

2 MARK QUESTIONS

1. What is SQL?

SQL stands for Structured Query Language. It is a standard language used to interact with databases. Data can be stored, retrieved, updated and deleted using SQL.

2. What are the three classifications of database commands?

- DDL – Data Definition Language
- DML – Data Manipulation Language
- DCL – Data Control Language

3. What is DDL?

DDL stands for Data Definition Language. DDL commands work on the schema (structure) of a database and are used to create, modify and remove database objects such as tables, views and indexes.

Examples: CREATE, ALTER and DROP.

4. What is DML?

DML stands for Data Manipulation Language. DML commands are used to manipulate data in a database. They are used to insert, retrieve, modify and delete data.

5. What is DCL?

DCL stands for Data Control Language. DCL commands are used to control access to the database.

Examples: GRANT and REVOKE.

6. Write the syntax of the CREATE command.

```
CREATE TABLE table_name (  
    column1 datatype1 [constraint],  
    column2 datatype2 [constraint],  
    ...  
    columnN datatypeN [constraint]  
);
```

7. What is VIEW in SQL?

A view is a virtual table that does not physically store data separately. It displays data derived from one or more base tables.

Syntax:

```
CREATE VIEW student2021 AS SELECT * FROM Student WHERE  
admission_year = 2021;
```

8. What is DESC command?

DESC command is used to view the description/structure of a table.

Syntax:

```
DESC table_name;
```

Example:

```
DESC Student;
```

9. Write the use of TRUNCATE command.

- TRUNCATE is used to delete all rows from a table.
- The table structure remains unchanged.
- The deleted data generally cannot be recovered using ROLLBACK.

Syntax:

```
TRUNCATE TABLE table_name;
```

Example:

```
TRUNCATE TABLE Student;
```

10. Differentiate between DROP and DELETE commands.

DELETE removes selected records from a table and can be used with a WHERE clause. DROP removes the entire table, including its structure and data.

Example:

```
DELETE FROM Student WHERE S_id = 1010;
```

```
DROP TABLE Student;
```

11. What is the use of GROUP BY clause?

GROUP BY is used to form groups of rows based on the values in one or more columns.

Example:

```
SELECT Course, COUNT(*) FROM Student GROUP BY Course;
```

12. What is the use of HAVING clause?

HAVING is used to specify a condition on groups created by the GROUP BY clause.

Example:

```
SELECT Course, COUNT(*) FROM Student
```

```
GROUP BY Course
```

```
HAVING COUNT(*) >= 50;
```

13. What is DISTINCT keyword in SQL?

DISTINCT is used to eliminate duplicate values from a column.

Example:

```
SELECT DISTINCT Course FROM Student;
```

14. What is the use of ORDER BY keyword in SQL?

ORDER BY is used to sort the result in ascending (ASC) or descending (DESC) order. ASC is the default order.

Examples:

```
SELECT * FROM Student ORDER BY Name;
```

```
SELECT * FROM Student ORDER BY Name DESC;
```

15. How are range queries written in SQL?

The BETWEEN AND operator is used to specify a range in SQL.

Example:

```
SELECT * FROM Student WHERE Annual_Income BETWEEN 200000 AND 400000;
```

Alternative:

```
SELECT * FROM Student WHERE Annual_Income >= 200000 AND  
Annual_Income <= 400000;
```

16. List out the various set operations in SQL.

- UNION
- UNION ALL
- INTERSECT
- MINUS

17. Differentiate between UNION and UNION ALL commands.

Both commands combine the results of two queries. UNION eliminates duplicate rows, whereas UNION ALL includes duplicate rows.

18. List out the various outer join commands in SQL.

- LEFT OUTER JOIN
- RIGHT OUTER JOIN
- FULL OUTER JOIN

19. What is DATEDIFF()?

DATEDIFF() returns the number of days between two dates.

Example:

```
SELECT DATEDIFF('2025-10-10', '2025-10-01');
```

20. What is TIMEDIFF()?

TIMEDIFF() returns the difference between two time values.

Example:

```
SELECT TIMEDIFF('12:00:00', '09:03:00');
```
